

CSS Text Shadow

Topics : [CSS](#)

Written on [March 19, 2021](#)

The text-shadow property is used to add shadow effect to text. The text-shadow property is used to add color to text. The text-shadow property is used to add a blur effect to the shadow.

Syntax:

text-shadow: h-shadow v-shadow blur-radius color|none|initial|inherit;

Values :

1. h-shadow: It is the required value. It specifies the position of the horizontal shadow and allows negative values.
2. v-shadow: It is also the required value that specifies the position of the vertical shadow. It does not allow negative values.
3. blur-radius: It is the blur-radius, which is an optional value. Its default value is 0.
4. color: It is the color of the shadow and also an optional value.
5. none: It is the default value, which means no shadow.
6. initial: It is used to set the property to its default value.
7. inherit: It simply inherits the property from its parent element.

Example :

```
<html>
<head>
  <title>Learn Css text shadow tutorials</title>
</head>
<body>
  <p style = "text-shadow:5px 5px 9px yellow;">Learn Css text shadow tutorial to set yellow shadow
text by aryatechno</p>
