Java Class Attributes

Topics : JAVA
Written on February 15, 2023

Class variables are called as java attributes for class.

We can define variable by data types.

Example :

public class Main {
  int p = 9;
  int q = 2;
}

As per as above example, variable p and q are called as attributes for class Main.

We can access attributes by creating an object of the class as below.

Main obj = new Main();
System.out.println(obj.p);
System.out.println(obj.q);

Example :

```
import java.util.*;

public class Demo {
int p =687;
public static void main(String[] args) {
Demo obj = new Demo();
System.out.println("Value for class attribute p is "+obj.p);
}
}
```

Output :

```
Value for class attribute p is 687
```
