

# Laravel - Authentication

Topics : [Laravel](#)

Written on [December 25, 2023](#)

Authentication is a crucial aspect of web development, and Laravel provides a robust and easy-to-use authentication system. Laravel's built-in authentication scaffolding includes controllers, views, and routes for common authentication features like registration, login, and password reset. Here's a guide on authentication in Laravel:

## 1. Setting Up Authentication:

Laravel includes an `artisan` command for scaffolding the basic views and controllers needed for authentication.

```
php artisan make:auth
```

This command will generate the necessary files in your application, including controllers, views, and routes.

## 2. Configuring Authentication Drivers:

Laravel supports multiple authentication drivers, such as Eloquent, Database, and LDAP. You can configure the authentication driver in the `config/auth.php` file.

## 3. Using the Auth Facade:

The Auth facade provides a convenient way to interact with the authentication service.

```
use Illuminate\Support\Facades\Auth;

// Check if the user is authenticated
if (Auth::check()) {
    // User is authenticated
}

// Get the currently authenticated user
$user = Auth::user();
```

## 4. Authentication Routes:

Laravel's authentication scaffolding includes routes for common authentication actions. You can find these routes in the `routes/web.php` file.

## 5. Protecting Routes:

To protect routes so that only authenticated users can access them, you can use the `auth` middleware.

```
Route::get('/dashboard', 'DashboardController@index')->middleware('auth');
```

## 6. Customizing Authentication Views:

If you want to customize the authentication views, you can find them in the `resources/views/auth` directory.

## 7. Customizing Authentication Controllers:

If you need to customize the behavior of the authentication controllers, you can find them in the `app/Http/Controllers/Auth` directory.

## 8. Registration and Login Throttling:

Laravel includes a feature to throttle registration and login attempts to prevent abuse.

## 9. Authentication Guards:

Laravel supports multiple authentication guards, allowing you to authenticate users based on different conditions (e.g., web, API).

## 10. Password Reset:

Laravel includes built-in functionality for password resets. The `make:auth` command also generates the necessary views and controllers for resetting passwords.

## 11. Manually Authenticating Users:

You can manually authenticate users in your controllers or other parts of your application.

```
use Illuminate\Support\Facades\Auth;
```

```
public function login()
{
    if (Auth::attempt(['email' => $email, 'password' => $password])) {
        // Authentication passed
        return redirect()->intended('dashboard');
    }
}
```

## 12. Protecting Routes Based on Roles:

You can create middleware to protect routes based on user roles.

```
public function handle($request, Closure $next, $role)
```

```
{
    if (!Auth::user()->hasRole($role)) {
        abort(403, 'Unauthorized action.');
```

### **13. Remember Me Functionality:**

Laravel supports "Remember Me" functionality for user sessions.

### **14. Authentication Events:**

Laravel fires events during the authentication process. You can listen to these events to perform custom actions.

### **15. API Authentication:**

For API authentication, Laravel provides Passport, which is a full OAuth2 server implementation.
